

Why take on a significant income risk as a grower when you can protect your earnings with a modest investment in harmonica insect netting

The threat of harmful insects keeps increasing due to:

-  – Climate change
-  – Globalisation & trade
-  – Intensive horticulture

Insect netting suitable for all types of ventilation systems in venlo, wide-span and poly greenhouses.

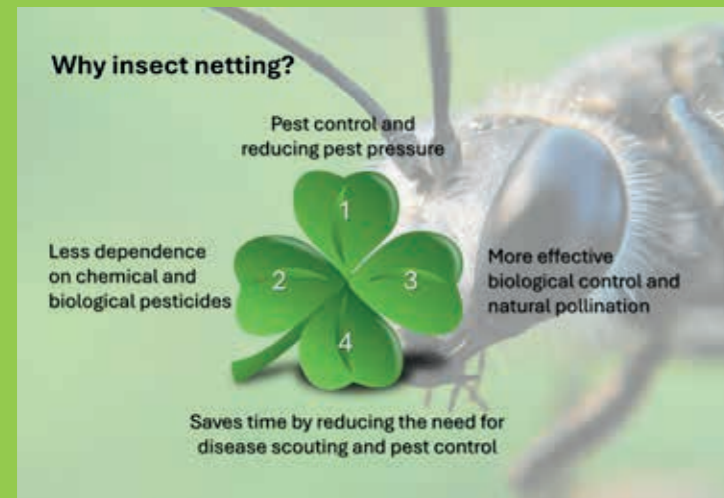

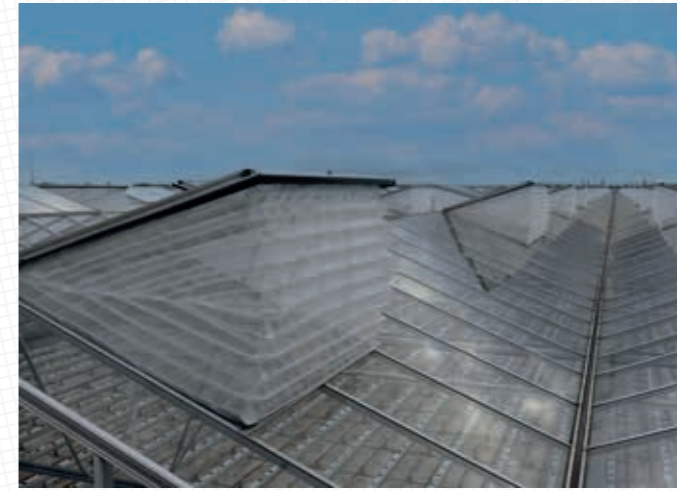

DUTCH NETTING SYSTEMS

Insect netting: the reliable insurance policy for your income

With the increasing threat of insect pests that can damage crops and the rising number of legal restrictions regarding the use of pesticides, the need for effective preventive measures is growing. Insect netting offers a sustainable solution that not only prevents immediate damage but also contributes to the continuity of your company.

By investing in high-quality insect netting, you are not only protecting your environment, but also your long-term financial stability. This investment minimises risk and maximises the security of uninterrupted insect pressure management.

“High-quality greenhouse horticulture: Unique in producing a controlled climate, but insufficient in keeping out harmful insects, that increase risks and reduce yields.”

The advantages of insect netting:

- Insect netting keeps unwanted insects out.
- At the same time, it keeps beneficial insects inside.
- Reduces the need for chemical and biological pesticides.
- Retains CO2 for longer periods of time in the greenhouse.
- Puts less strain on the environment.
- It is easy to clean.
- Reduces airflow in the greenhouse, creating a more stable climate.
- Saves time by reducing the need for disease scouting and pest control.
- The light entering through insect netting will be diffused.

Who are we?

Dutch Netting Systems is much more than just an insect netting company. With extensive experience in the industry, we know what works and deliver effective solutions, fully tailored to your situation. We are personally involved in every project and committed to continuous improvement. Our short lines of communication and effective solutions are what set us apart in the market.

With the right materials, you take back control and get a better grip on the conditions inside the greenhouse. This allows you to optimise both your crop and yield. It not only ensures a healthier crop, but also improves the sustainability and efficiency of your production.

Insects do not stand a chance!

Our insect netting system features a harmonica-style design in an aluminium frame. The netting is made of UV-stabilised polyester, ensuring long-term resistance to discolouration and wear caused by sunlight. As a result, it provides a durable solution for keeping unwanted visitors out.

The EZ-guide® guidance system ensures precise folding of the sheets and keeps them neatly aligned under all weather conditions. Through the alternating loops on the sheets, the guiding system covers a very large surface area. The innovative clamping bracket allows for efficient assembly of the system. The EPDM sealing rubbers provide an optimal seal, ensuring that when the vents close, they are truly closed. Moreover, it requires little to no maintenance, making it a practical and durable asset to your business.
